

FINAL PROJECT REPORT

Employee Raise Issue – Record Producer and Service Portal Integration

1. INTRODUCTION

1.1 Project Overview	This project implements an automated, centralized ticketing system on the ServiceNow platform, enabling employees to report workplace-related issues seamlessly through a custom self-service portal rather than relying on unorganized emails [cite: 29].
1.2 Purpose	To eliminate manual administrative bottlenecks, enforce structured data capture, provide real-time status tracking via standard ticket pages, and streamline issue resolution for support teams [cite: 29].

2. IDEATION PHASE

2.1 Problem Statement	Traditional workplace grievance and issue reporting relies heavily on fragmented emails or informal verbal communication, leading to missing information, delayed tracking, and lack of accountability [cite: 29].
2.2 Empathy Map Canvas	• Says: 'It takes too long to find who to email when my office equipment breaks.' • Thinks: 'Are my complaints even being recorded or tracked anywhere?' • Does: Sends multiple follow-up emails and relies on colleagues for support contacts. • Feels: Frustrated by lack of visibility and administrative delays [cite: 29].
2.3 Brainstorming	Explored solutions including custom email parsers, third-party ticketing tools, and native ServiceNow Service Portal workflows. Selected the Record Producer + Service Portal approach for optimal speed and native integration [cite: 29].

3. REQUIREMENT ANALYSIS

3.1 Customer Journey map	1. Discovery: Employee lands on Service Portal homepage. 2. Engagement: Clicks 'Raise an Issue' widget. 3. Action: Fills out dynamic Record Producer form with category choices. 4. Confirmation: Receives ticket ID (e.g., EMP0001011) and monitors status [cite: 29].
3.2 Solution Requirement	• Scoped application container for module isolation (x_1959081_emp_issue). • Custom backend table with restricted ticket numbering. • Dynamic UI policies and dependent dropdown lists. • Configured Service Portal homepage layout with custom widgets [cite: 29].
3.3 Data Flow Diagram	User Portal Input -> Record Producer -> Scoped Application Scope (x_1959081_emp_issue) -> Custom Backend Table (employee_raises_issue) -> Assigned Support Team Tracking [cite: 29].
3.4 Technology Stack	• Platform: ServiceNow Developer Instance (Vancouver/Washington) • Frameworks: Service Portal (Bootstrap / AngularJS) • Core Language: JavaScript (Client Scripts, UI Policies, Business Rules) [cite: 29]

4. PROJECT DESIGN

4.1 Problem Solution Fit	Directly addresses the lack of structured communication by replacing unstructured emails with validated form fields and automatic record generation [cite: 29].
4.2 Proposed Solution	A dual-widget Service Portal homepage coupled with a custom Record Producer that maps user input directly into a secured custom table [cite: 29].
4.3 Solution Architecture	Model-View-Controller portal layout interacting with core ServiceNow table schemas inside a dedicated application boundary [cite: 29].

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning	• Sprint 1: Scoped App Setup & Custom Table Creation (8 Points) • Sprint 2: UI Policies, Dependencies & Record Producer (8 Points) • Sprint 3: Service Portal & Widget Layouts (8 Points) • Sprint 4: Testing, UAT Validation & Deployment (6 Points) Total Story Points: 30 Team Velocity: 7.5 Points/Sprint [cite: 29]
-----------------------------	--

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing	• Portal Load Speed: Verified widget rendering completes in under 3 seconds. • Record Creation Latency: Form submission and standard ticket redirect execute instantaneously. • Functional Accuracy: 100% pass rate across UI policy triggers, read-only field locks, and table storage validation [cite: 29].
--------------------------------	--

7. RESULTS

7.1 Output Screenshots	• Service Portal Designer: Custom widgets layout successfully rendered. • Record Producer Form: Clean catalog interface with dynamic fields. • Ticket Confirmation: Standard Ticket view displaying ticket EMP0001011. • Backend Storage: Custom table list view verifying accurate record retention [cite: 29].
-------------------------------	--

8. ADVANTAGES & DISADVANTAGES

Advantages	• Centralized and structured issue tracking. • Eliminates incomplete information common in emails. • Zero licensing overhead using developer instances and native portal modules [cite: 29].
Disadvantages	• Restricted to users with ServiceNow portal access. • Requires baseline administrative knowledge for advanced modifications [cite: 29].

9. CONCLUSION

Conclusion	Successfully designed and deployed an end-to-end Employee Raise Issue application on ServiceNow, significantly reducing manual communication overhead and establishing robust data tracking protocols [cite: 29].
-------------------	---

10. FUTURE SCOPE

Future Scope	• Integration with automated email notifications on state changes. • Implementation of an analytics dashboard for management trend reporting. • Addition of live chat support directly within the portal workspace [cite: 29].
---------------------	--

11. APPENDIX

Source Code / Dataset / Demo Links	• Source Code / Scoped App XML: Available inside ServiceNow application repository. • Dataset Link: Native ServiceNow table records (employee_raises_issue). • GitHub & Project Demo Link: Hosted via ServiceNow Developer Instance demo recording [cite: 29].
